

how to:

804NOISE FM/Intrusion

FM/Intusion is an event where performers broadcast live audio via an inexpensive fm transmitter designed for use with mp3 players in cars. To hear the performance you must come with headphones and FM walkmen receiver. Indoors this transmitter can potentially reach a 50 foot radius making it ideal for renegade events inside libraries, churches, or various other small public spaces. 804noise utilized this tactic in 2001 at the VCU Library in front of the Starbucks Cafe due to the fact that we weren't able, for a long period of time, to find "proper" venues to have experimental events. This made it possible to have them anywhere anytime without anyone (unless we wanted them to) knowing anything about it.

Suggestions:

- laptops may seem the most versatile for these situations, but try experimenting with battery powered instruments, ie. toys, circuit bent keyboards, effect pedals, etc.
- make sure you have adpaters
ie. 1/4" to 1/8"
- buy an extention for the transmitter, they sometimes help carry the signal further, like an antenna.
- there are many different brands of low power trasnmitters avaiable these days, but we know the one pictured works.
